

Carbon Capture and Storage Development in the Tri-state

Tenaska is developing a carbon capture and storage (CCS) project in Harrison, Jefferson, and Carroll Counties in Ohio, as well as Hancock County in West Virginia. Our team is talking with local landowners about potential leasing opportunities and receiving positive feedback.

CCS helps industrial producers meet environmental requirements in a cost-effective and responsible manner by capturing carbon dioxide (CO₂), transporting it, and storing it deep underground.

Our approach is relationship driven. We know your land is your livelihood, and Tenaska wants to work with landowners to develop a safe and environmentally responsible project that benefits you and your community.

Have questions? Contact: mtenkley@tenaska.com | (402) 213-3075

Up to 60,000 acres of underground pore space

4 to 10 above-ground injection wells

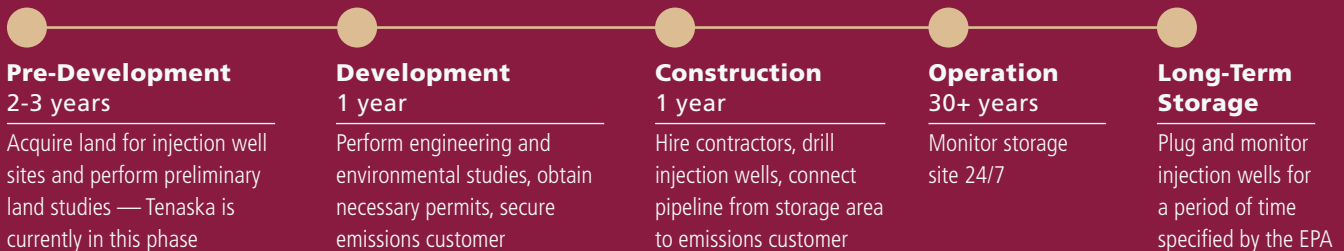

35 years of Tenaska energy development experience

LANDOWNER BENEFITS

CCS projects are great financial opportunities for landowners:

- ▲ Create value from an unused part of the land's geology deep beneath the surface and receive payments from the pore space rights for decades.
- ▲ Continue using the majority of your land. Other than a few carefully sited wells above ground, the storage area is safely located deep underground.
- ▲ Rest assured that this is a profit-positive opportunity. Costs associated with the development, construction and operation of the storage field are paid for by the company.

PHASES OF A CCS PROJECT

ABOUT TENASKA

Tenaska is a leading energy company with Nebraska roots. Over the past 35 years, Tenaska has earned a reputation for developing responsible energy projects and being a good business neighbor. We have developed, managed and/or operated approximately 22,000 megawatts of natural gas-fueled and renewable energy generating facilities.

From a five-person operation in 1987 to more than 700 employees today, Tenaska is proud to serve our nation's energy needs.

What is Carbon Capture and Storage?

Carbon capture and storage (CCS), also known as carbon capture and sequestration, helps industrial producers meet environmental requirements in a cost-effective and responsible manner by capturing carbon dioxide (CO₂), transporting it, and storing it safely and permanently deep underground.

Tenaska representatives are reaching out to landowners in this area about acquiring access to pore space on their property. Pore space rights are similar to mineral rights, but we would acquire the rights to store CO₂ rather than remove it.

Watch our CCS 101 video by scanning this code with a mobile device.

Carbon Capture and Storage Process

Capture: CO₂ is captured at the point of emission, such as ethanol plants, agribusiness, natural gas processing plants, steel processing and other facilities, or through direct air capture, rather than being released into the atmosphere. The CO₂ is then processed and compressed into a liquid.

Transportation: A high-strength carbon steel pipeline system safely delivers the liquified CO₂ to a storage site.

Storage: The liquified CO₂ is injected deep underground, where it is stored in porous rock and sealed beneath a thick layer of impermeable cap rock. The CO₂ then naturally mineralizes and dissolves over time.

Landowner Benefits

We know your land is your livelihood, whether you use it for farming, ranching, recreation, leasing or other purposes. Tenaska aims to be a good steward of this land, to support its long-term preservation, and to provide an added source of income for your family over the next 30+ years.

Create another income stream. A carbon capture and storage (CCS) project allows landowners to create value from an unused part of the land's geology deep beneath the surface. Your family can receive payments from the pore space rights for decades.

Continue utilizing the majority of your land. Other than a few carefully sited wells above ground, the storage area is safely located deep underground. You can continue using the land's surface for other purposes.

Rest assured that this is a profit-positive opportunity. Costs associated with the development, construction and operation of the storage field are paid for by the company.
